### Content

Brief	Explanation
Illumina Clinical Services Laboratory	Illumina submitted 138336 variant interpretations representing 94502 variants.
Emory Genetics Laboratory	Emory provided 29831 variant interpretations, including both novel and updated interpretations.
GeneDx	GeneDx submitted 24889 variant interpretations, including both novel and updated interpretations.
Children's Hospital of Philadelphia	CHOP provided 67 novel interpretations for variants in the FGFR1, FOXP1, and FOXP2 genes.
Variant merges	NCBI has been making improvements to our processing that determines when multiple variant descriptions, such as HGVS expressions, represent the same variant. As a result, 629 variants in ClinVar, represented as Measure in the XML, were merged with redundant variant records.
Coming soon - ClinVar will adopt the new HGVS standard for variants that are intronic or outside the UTRs	HGVS standard states that "the reference sequence used must contain the residue(s) described to be changed." Therefore "a coding DNA reference sequence does not contain intron or 5' and 3' gene flanking sequences and can therefore <b>not be used as a reference</b> to describe variants in introns and up/down-stream of the gene." ClinVar is working to adopt this standard so we encourage our submitters and users to start describing these variants on genomic sequence instead.  <a href="http://varnomen.hgvs.org/recommendations/general/">http://varnomen.hgvs.org/recommendations/general/</a> <a href="http://varnomen.hgvs.org/bg-material/numbering/">http://varnomen.hgvs.org/bg-material/numbering/</a>
