

# GO Curation Calendar

Jane Lomax

Inspired by Reactome, we hope to create a curation calendar showing which topics the different GO editors are working on, which they plan to be working on, and when. The topics listed on the calendar will be linked to a summary page, which describe the background and progress on that topic. The topic page will have links to join the appropriate interest groups, and relevant SF items. This should make it easier for external and internal people to provide input to GO development, and help us organise our curation time more effectively.

Background for the topic, including links to all other relevant material, including the mailing list archive, SF items, webpages, and papers in the text.

A summary of the proposal. Links to the full proposal.

March 2006 - Nov 2006

Summary

The current Transporter Function Ontology is based on an inappropriate classification system and needs to be rewritten. We are developing an alternative system where the classification is based on the substrate being transported and the mechanism of transport.

Background

The transporter node is rife with mistakes of almost every conceivable nature. The fundamental problem was that the ontology was originally written to parallel Saier's Transporter Classifications, with the idea that the "TC" structure could be treated similarly to the way we treat "EC" structure. Unfortunately, much of Saier's classification scheme doesn't work well for the function ontology. In general, he describes and classifies gene products and complexes, not functions. As a consequence, there are many duplicate terms in the ontology that were created when folks didn't find the exact wording that they were looking for. In addition, Saier considers phylogeny in his classification scheme, which seems counter to the whole GO approach.

Current proposal

Everything covered here is to do with transport across a membrane.

The kinds of transporters carrying out this transport can be classified using just a small number of criteria.

1) active or passive  
2) substrate transported  
3) mechanism of transport  
4) pore or narrow pore  
5) gated or not gated  
6) symporter, antiporter or uniporter

An explanation of how all this fits together into the proposal presented here.
